

Dear User,

This is a small **update manual** that should help you migrating from 0-65 to 0-66.

Regards

Thomas Bley (mgw-dev team)

- [General Concept](#)

General Concept

Take your mgw 0-65, don't run setup, only follow these steps to update the webmail-module from 0-65 to 0-66.

Attention:

You need to update the settings-module first !!

You need to have ALTER-RIGHTS at your MySQL-Database !!

Requirements:

The Webmail-Module must be installed in 0-65.

1. Make a complete backup of your old webmail-directory. (<0-65>/modules/webmail2)
2. Make a backup of your database.
(the whole database or webmail-tables: mgw_webmail_accounts, mgw_webmail_mailboxes, mgw_webmail_messages)
3. Verify your backups.
4. Copy the new (webmail-)files from the 0-66 final release to <0-65>/modules/webmail2
(That means you **overwrite** <0-65>/modules/webmail2, inc, lang, setup, templates.
Do **NOT** overwrite or delete webmail2/store !!)
5. Delete all contents of <0-65>/modules/webmail2/cache (only the contents, not the directory itself)
6. Open your Webbrowser and launch:
`http://<Server-Name>/<mgw-directory>/modules/webmail2/update-0-65--0-66.php`
(This script converts your database from 0-65 to 0-66)
7. Now you are ready to enjoy webmail for mgw 0-66 !
